

# Portal

A **portal app is a platform which is set up solely to house other platforms within.**

If you wish that platform you are working on to be the portal you will need to **add a portal module** via the builder in the CMS.

Once added, you can then **link any other platforms** and house them within the portal by searching for that platform/app name in the list.

Once added, there is the option to add a list icon image, banner image, add an info page or make it a featured app. Dimensions for both images are shown on the CMS.

Only one app in each portal can be the featured app.

There are **two screens on the portal** which can be branded; the screen on which you enter and the background on which the apps sit.

**In order for the portal to work correctly** then both platforms (the portal one and any/all apps which sit within it) must be set to the same security level.
